

Project Design Phase

Solution Architecture

Team ID	SWTID-2026-2971
Team Leader	Gowsik Raja S
Team Members	Shrija M; Swetha M; Sivaram A

1. Architecture View

Layer	Component	Responsibility
Source	Spreadsheet	Contains employee data prepared for import.
Staging	Employee Import (u_employee_import)	Holds loaded source rows before transformation.
Transformation	Sample Spreadsheet Import	Maps source fields to Employee Test and applies matching behavior.
Target	Employee Test (u_employee_test)	Stores transformed employee records.
Reporting	Three ServiceNow reports	Summarizes records by department, location, or list.
Presentation	Employee Analytics Dashboards	Combines the reports into a consolidated dashboard.

2. Logical Flow

[Spreadsheet] → [Import Set / Employee Import] → [Transform Map] → [Coalesce Matching] → [Employee Test] → [Reports] → [Dashboard]

3. Data Fields

Source/Target Field	Type in Employee Test
Employee ID	String
Employee Name	String
Email	String
Department	String
Location	String

4. Design Principle

The architecture separates data intake, staging, transformation, target storage, and reporting so each step can be checked independently.

5. Architecture Sequence

The architecture begins outside ServiceNow with the prepared spreadsheet. The Load Data operation moves source rows into the Employee Import staging layer. The Transform Map reads that staging data and applies

source-to-target mapping. Coalesce matching is considered during transformation. The target records are stored in Employee Test. Reporting components query the target data, and the dashboard presents the saved reports together.

6. Separation of Responsibilities

Separating staging from target storage makes it possible to inspect the imported data before it becomes the final employee record set. Separating transformation from reporting also ensures that the reporting layer works from the target data rather than directly from the raw spreadsheet.

7. Architecture Validation Points

There are validation points at every major boundary: spreadsheet preparation, import completion, Transform Map configuration, transformation success, target-table verification, repeat-import history, report execution, and dashboard presentation.

8. Architecture Limitations

This architecture reflects the scope of the supplied guide. It does not claim to include external enterprise systems, automated scheduling, API integration, production deployment, or high-volume scalability design because those elements are not documented in the source.
