

Requirement Analysis

Technology Stack

Team ID	6ab7f27c8c7c66e7067292d1
Team Leader	Gowsik Raja S
Team Members	Shrija M; Swetha M; Sivaram A

Layer	Technology / Feature	Use in Project
Platform	ServiceNow	Primary platform for data import, transformation, records, reports, and dashboard.
Source	Google Spreadsheet / Excel file	Provides structured employee input data.
Staging	Import Sets	Receives spreadsheet rows before transformation.
Transformation	Transform Maps	Maps and transforms source fields into the target table.
Matching	Coalesce	Determines whether matching data should update an existing record rather than create a duplicate.
Data Store	Custom ServiceNow table	Employee Test (u_employee_test) stores final employee records.
Reporting	ServiceNow Reports	Creates department, location, and employee list reports.
Visualization	ServiceNow Dashboards	Employee Analytics Dashboards contains the project reports.

Implementation Notes

The source guide does not describe custom code, external APIs, a separate database, or additional application frameworks. Those technologies are therefore not included as project requirements.

1.1 Platform Architecture

ServiceNow acts as the central application platform. The project does not require a separate custom backend because the guide performs data loading, transformation, record management, reporting, and dashboard configuration inside ServiceNow.

2. Component Responsibilities

The spreadsheet supplies the initial data. Import Sets provide staging. Transform Maps define the movement of source information into the target table. Coalesce controls matching behavior during repeat imports. Reports turn target records into visual summaries or lists, while the dashboard provides a consolidated presentation layer.

3. Configuration Objects

The primary configured objects are Employee Test (u_employee_test), Employee Import (u_employee_import), Sample Spreadsheet Import, Employees by Department, Employees by Location, Employee List Report, and Employee Analytics Dashboards. These names are taken directly from the project guide.

4. Technology Selection Rationale

The selected ServiceNow features are appropriate because the project itself is a ServiceNow micro project and the source guide demonstrates each feature as part of the intended workflow. The design avoids adding technologies that are not necessary for the documented objective.

5. Limitations of the Stack Description

The guide does not specify ServiceNow release/version, browser version, database engine, source-control system, custom scripts, REST APIs, or deployment pipeline. Those details are intentionally not asserted as project components.
