

Project Design Phase

Problem – Solution Fit Template

Team ID	6ab7f27c8c7c66e7067292d1
Team Leader	Gowsik Raja S
Team Members	Shrija M; Swetha M; Sivaram A

1. Problem

Structured employee data is received externally in spreadsheet form and needs to be brought into ServiceNow accurately, with controlled field mapping, duplicate handling, and useful visibility.

2. Proposed Solution

Use ServiceNow Import Sets for staging and Transform Maps for controlled source-to-target transformation, then apply Coalesce for matching and build reports/dashboard views for validation and consumption.

3. Fit Analysis

Problem Need	Solution Mechanism	Evidence in Project Guide
Bulk structured import	Import Set	Spreadsheet is loaded into Employee Import.
Field conversion/mapping	Transform Map + Mapping Assist	Source and target fields are mapped before transformation.
Existing record handling	Coalesce	Matching records are updated rather than inserted as duplicates.
Verification	Employee Test + Transform History	Transformation results are checked in the target table and history.
Visibility	Reports + Dashboard	Three reports are created and added to Employee Analytics Dashboards.

4. Outcome

The solution directly aligns with the workflow demonstrated by the project guide without introducing additional unsupported components.

5. Detailed Fit Assessment

The solution fits the problem because each major need is addressed by a specific ServiceNow capability. Data ingestion is handled by Load Data and the Import Set. Transformation is handled by the Transform Map. Record matching is handled through Coalesce. Validation occurs in Employee Test and Transform History. Consumption is supported by reports and the dashboard.

6. Risk-to-Response Mapping

Incorrect mappings are reduced by reviewing source and target fields with Mapping Assist. Duplicate creation is reduced through Coalesce. Import uncertainty is reduced by checking the import state and success message. Transformation uncertainty is reduced by inspecting Employee Test after the transform. Reporting requirements are addressed through three explicit report configurations.

7. Fit Conclusion

The project does not require a complex integration architecture because its stated objective is a structured spreadsheet import. The selected features are therefore closely aligned with the demonstrated scope and provide an understandable path from source data to usable ServiceNow records.
