Executive Summary

This project demonstrates a complete ServiceNow workflow for importing structured employee information from a spreadsheet. The implementation uses an Import Set as a staging area, a Transform Map for source-to-target mapping, Coalesce for matching existing records, and ServiceNow reports and a dashboard for visibility.

1. Problem Statement

How can structured employee data received in spreadsheet format be imported into ServiceNow accurately, transformed into a target employee table, updated safely when matching records already exist, and presented through useful reports and a dashboard?

2. Objectives

- Create and populate the Employee Test target table.
- Stage spreadsheet data in Employee Import.
- Configure and execute Sample Spreadsheet Import.
- Demonstrate Coalesce-based insert/update behavior.
- Create three employee reports.
- Create Employee Analytics Dashboards and add the reports.

3. Implementation

Phase	Implementation
Data Preparation	Sample employee spreadsheet prepared and downloaded as Excel.
Target Table	Employee Test / u_employee_test with five String fields.
Import Set	Employee Import / u_employee_import used as staging.
Transform Map	Sample Spreadsheet Import maps Employee Import to Employee Test.
Validation	Transformation results verified in Employee Test.
Coalesce	Selected field map configured for matching and updates.
Reports	Department pie, location bar, and employee list reports.
Dashboard	Employee Analytics Dashboards contains all three reports.

4. Validation Results

The documented four-row test after Coalesce produced two inserted records for new employee IDs and two updated records for existing IDs whose values changed. Repeating the same sheet resulted in four ignored rows, with zero inserts and zero updates.

5. Conclusion

The project demonstrates the end-to-end use of ServiceNow Import Sets and Transform Maps for structured employee-data migration, with Coalesce providing matching behavior and reports/dashboard providing visibility. The guide supports the described functional workflow; it does not provide quantitative performance benchmarks or formal deployment evidence.

6. Detailed Implementation Narrative

The implementation begins with a Google Spreadsheet containing sample employee data, which is downloaded as Sample Spreadsheet.xlsx. The ServiceNow target table Employee Test is then created with Employee ID, Employee Name, Email, Department, and Location. The spreadsheet is loaded through Load Data into Employee Import, creating the staging layer. The Sample Spreadsheet Import Transform Map is then configured from Employee Import to Employee Test.

7. Transformation and Matching

The guide instructs the team to use Auto Map Matching Fields and Mapping Assist before saving the Transform Map. After the first successful transformation, the target table is checked to confirm that records were created. Coalesce is then enabled on a selected field map so that later imports can distinguish matching employee records from new records.

8. Repeat-Import Demonstration

The documented repeat-import test contains four rows. Two rows represent new employee IDs and are inserted. Two rows represent existing IDs with changed values and are updated. When the same sheet is submitted again, all four rows are ignored, with zero inserts and zero updates. This sequence demonstrates the practical purpose of the matching configuration.

9. Reporting and Dashboard

The final reporting layer contains three reports. Employees by Department uses a pie chart, Employees by Location uses a bar chart, and Employee List Report uses a list with five specified columns. These reports are then added to Employee Analytics Dashboards, creating a consolidated view of the target data.

10. Project Significance

The project demonstrates how a relatively small ServiceNow configuration can represent a complete data-management lifecycle: source preparation, staging, transformation, validation, matching, reporting, and dashboard presentation. It also provides a practical introduction to several core ServiceNow data-import concepts.

11. Limitations and Future Scope

The source guide does not include formal performance benchmarks, production deployment, external API integration, automated scheduling, or enterprise-scale security design. Future work could evaluate larger datasets, formal performance measurements, scheduled imports, additional validation rules, and more detailed operational controls if those requirements are introduced.
