

Project Development Phase

Performance Testing

Team ID	SWTID-2026-2971
Team Leader	Gowsik Raja S
Team Members	Shrija M; Swetha M; Sivaram A

1. Purpose

This document records validation relevant to import behavior and repeatability. The source guide demonstrates functional outcomes rather than measured response-time or throughput benchmarks.

2. Test Scenarios

Test ID	Scenario	Expected Result	Guide-Supported Result
PT-01	Initial spreadsheet import and transform	Records are created in Employee Test.	Successful import and records created.
PT-02	Four-row repeat import with two new IDs and two changed existing records	New IDs insert; matching IDs update.	2 inserted and 2 updated.
PT-03	Repeat the same spreadsheet again	No new inserts or updates; rows are ignored as already matching.	4 ignored; 0 inserted and 0 updated.
PT-04	Department report	Report groups Employee Test records by Department and counts them.	Configured as documented.
PT-05	Location report	Report groups records by Location and counts them.	Configured as documented.
PT-06	Employee list report	List shows the five required employee columns.	Configured as documented.

3. Performance Measurement Limitation

No numerical response-time, throughput, concurrency, CPU, memory, or scalability benchmark is provided in the guide. The documented evidence is therefore limited to import outcomes and workflow validation.

4. Test Strategy

The project guide provides functional evidence of import and transformation outcomes rather than numerical performance measurements. The test strategy therefore concentrates on repeatability, correctness of record handling, and the ability of the reporting layer to operate on the resulting target data.

5. Detailed Test Procedure

For the initial import, the spreadsheet is loaded into Employee Import and the Transform Map is executed. For repeat-import testing, the guide uses four rows containing two new employee IDs and two existing IDs with changed values. The transform history is then reviewed. The same spreadsheet is subsequently submitted again to verify that previously handled rows are ignored.

6. Result Interpretation

The documented 2-insert/2-update result demonstrates that Coalesce can distinguish new records from matching records when the imported values differ. The later 4-ignored result demonstrates the behavior when the exact same sheet is submitted again.

7. What Was Not Measured

The guide contains no measured response time, maximum rows per import, throughput per minute, concurrent-user test, memory consumption, CPU utilization, or load-test results. These should not be inferred from the functional results.

8. Recommendations for Future Measurement

If formal performance testing is later required, the project could record import duration, transformation duration, row counts, error counts, and results across increasing spreadsheet sizes. Such measurements would be additional testing beyond the evidence supplied in the current guide.
